

Python HW

You have one hour to work on this homework. Find one uninterrupted hour

- In a markdown cell write down what time you started the homework
- work for one hour or until done using your notes and other sources but not AI.
- After one hour ask AI to do each question.
- paste the AI answer in below your answer and run it also.
- you should have two clearly delineated code cells for each question with two sets of answers
- in a markdown cell below the two answers comment on the answers, differences, and what you have learned. (2-4 sentences)
- Your homework should look similar to this notebook. The only difference is your code won't be hidden. I have greyed out my code.
- Grading is not based on how well you coded but on how well you learned to code.
- Add a nice Markdown header to your Notebook with your name, HW, etc. You can even copy in these instructions. This is critical. If your notebook does not have your name and does not look nice you will lose points.
- Upload your homework to courseworks. You upload the notebook. The file you upload should end in .ipynb. DO NOT upload a pdf and do not upload screen shots. There is no need to export anything. Just go find your .ipynb notebook in your working folder and upload that to courseworks.
- Don't forget to Watch Next Video and Take Quiz

Start Time:

Q1

Use one print statement to make a capital letter of your first name. My B out of b's is below. In your print statement you can use your letter, \t, \n and minimal spaces. My example is below but you can make yours look nicer with your letter! You need to use one and only one print statement on only one line of code!.

My answer

```
BBBBBBb
B      B
B      B
B      B
BBBBBBb
B      B
B      B
B      B
BBBBBBb
```

Comparison

Q2

Set

a=9.000

b=4.000

Write the following sentence exactly. using print and the .format nomenclature and no numbers only variables. Use the a and b that you set in the format and print function. Use the different operators with your variables. Look at today's handout for examples with the print and format functions. The * should be in within the formatting calls. See exact sentence below and the check sentence.

Then to check you did it correctly. I will open your notebook. I will change your a=55.000 to a=4.000.

My Answer

When 9 is divided by 4.00 the answer is **2** with a remainder of 1.000

When 55 is divided by 4.00 the answer is **13** with a remainder of 3.000
