

Python HW

You have one hour to work on this homework. Find one uninterrupted hour

- In a markdown cell write down what time you started the homework and the AI model you are using
- work for one hour or until done using your notes and other sources but not AI.
- After one hour ask AI to do each question.
- paste the AI answer in below your answer and run it also.
- you should have two clearly delineated code cells for each question with two sets of answers
- in a markdown cell below the two answers comment on the answers, differences, and what you have learned. (1-4 sentences).
- If you got the correct answer and didn't need AI help you can just put a comment in, not needed and that you completed it. But I am assuming you learned something.
- Your homework should look similar to this notebook. The only difference is your code won't be hidden. I have greyed out my code.
- Grading is not based on how well you coded but on how well you learned to code.

Start time:

AI Model:

Q1 (Only one question)

Go back and find when you plotted the parabola and sin x. These are really nice graphs that you made.

- Use input and if statements to ask the user if they would like to plot sin x or to plot the parabola
- If they choose sin x use an input statement to determine the number of pi's they want to plot and plot the appropriate graph. This way you can show many pi values.
- If they choose a parabola have them enter the a,b,c of the parabola.
- For example if I choose sin of x I could then choose 32.1 pi's to plot.
- For example if I choose parabola I could then choose a=1, b=-5, c=0.02

You should have all your code in one ipython box so I can just run that one box, do my entries, and then see the plots.

- Remember to use input()
- To get an integer or float (remember to use them correctly, You need to choose when you think an integer or float is more appropriate) use input like
 - `a=int(input('please enter a number as an integer'))`
 - `myfloat=float(input('please enter a number as a float'))`

My Answer

We are going plot sine of x or a parabola
For sine 1
For parabola type 2
To plot a parabola we need an a, b, and c
